Sampling_Collecting	No
Sampling_Methods	We will use dip nets, kick seine, forceps and sample bottles. In the past, we have ended up with 30-40 species and about 1-2 samples of each species.
Description	We will be destructively sampling invertebrates from 3 habitat types in the BNP: forest, stream (North Fork), and pond (Round Pond). We will be preserving specimens in ethanol for later identification in the lab. We attempt to only take single samples of each species from any one habitat, so the impact of this sampling has always been minimal. Our goal is to continue to produce a list of invert species found at the BNP.
